

## Insights from Data: Malaria in Africa

### 1<sup>st</sup> insight:

On the main screen, we can clearly see that Kenya is by far the most affected country in Africa because the shading is darker than any other country.

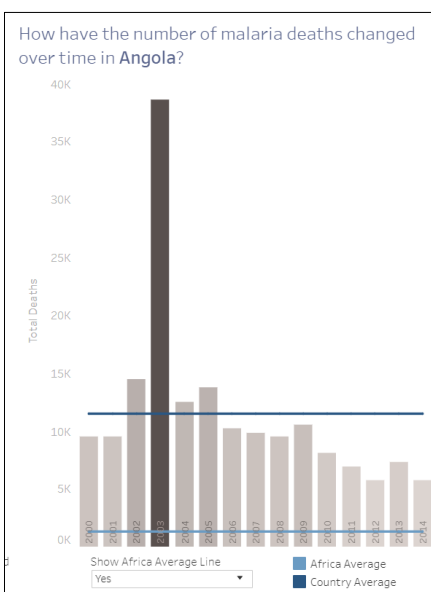

It is also interesting to note that not all the countries of the continent are included in the research. For example, countries like Libya and Morocco are not mentioned.

### 2<sup>nd</sup> insight:

By looking at the data provided for Gabon, we can see that the number of malaria deaths per year has drastically decreased in the country between 2000 and 2006. From 2006 on, the number of deaths remain between 100 and 300 every year until 2014, last year for which data are provided.

Data obtained by clicking on Gabon on the map.

### 3<sup>rd</sup> insight:

From the data provided for Angola concerning the number of malaria deaths per year, we can see a relatively flat evolution from 2000 to 2009, with the exception of 2003 where the number of deaths skyrocketed comparing of the other years of the period.

Starting in 2010 to 2014, a small decrease can be observed.
